Revised 6/20/2021

Speech-Language Pathology

Speech-Language Pathology

Speech Pathology involves the study, diagnosis, and treatment of disorders that relate to speech, language, swallowing, fluency, voice, and communication. A **speech pathologist** helps people who struggle with speech disorders because of developmental delays, stroke, brain injuries, learning disabilities, hearing loss, and other problems that can affect speech.

Speech exercises help retrain the muscles involved in speaking or swallowing. These exercises can help train the brain to understand words, numbers or gestures, as well as to improve concentration and information processing.

Speech Therapists use a variety of treatment methods including:

- ◆ Dysphagia management to retrain chewing and swallowing
- ◆ Cognitive therapy to improve attending, memory, and problem solving
- ◆ Speech therapy to improve dysarthria or slurred speech, apraxia and stuttering
- ◆ Language therapy to help with receptive expressive language skills
- ◆ Voice therapy to obtain use of optimum voice and eliminate abuses

Our skilled speech language pathologists are certified and are excited to help you communicate to your best potential and to eat/drink without fear!
